

Linked Lists

A linked list is a `Link` object or `Link.empty`.

You can mutate a `Link` object `s` in two ways: - Change the first element with `s.first = ...` - Change the rest of the elements with `s.rest = ...`

You can make a new `Link` object by calling `Link`: - `Link(4)` makes a linked list of length 1 containing 4. - `Link(4, s)` makes a linked list that starts with 4 followed by the elements of linked list `s`.

```
class Link:
    """A linked list is either a Link object or Link.empty

    >>> s = Link(3, Link(4, Link(5)))
    >>> s.rest
    Link(4, Link(5))
    >>> s.rest.rest.rest is Link.empty
    True
    >>> s.rest.first * 2
    8
    >>> print(s)
    <3 4 5>
    """
    empty = ()

    def __init__(self, first, rest=empty):
        assert rest is Link.empty or isinstance(rest, Link)
        self.first = first
        self.rest = rest

    def __repr__(self):
        if self.rest:
            rest_repr = ', ' + repr(self.rest)
        else:
            rest_repr = ''
        return 'Link(' + repr(self.first) + rest_repr + ')'

    def __str__(self):
        string = '<'
        while self.rest is not Link.empty:
            string += str(self.first) + ' '
            self = self.rest
        return string + str(self.first) + '>'
```

Q1: Sum Two Ways

Implement both `sum_rec` and `sum_iter`. Each one takes a linked list of numbers `s` and a non-negative integer `k` and returns the sum of the first `k` elements of `s`. If there are fewer than `k` elements in `s`, all of them are summed. If `k` is 0 or `s` is empty, the sum is 0.

Use recursion to implement `sum_rec`. Don't use recursion to implement `sum_iter`; use a `while` loop instead.

```
def sum_rec(s, k):
    """Return the sum of the first k elements in s.

    >>> a = Link(1, Link(6, Link(8)))
    >>> sum_rec(a, 2)
    7
    >>> sum_rec(a, 5)
    15
    >>> sum_rec(Link.empty, 1)
    0
    """
    # Use a recursive call to sum_rec; don't call sum_iter
    """*** YOUR CODE HERE ***"""

def sum_iter(s, k):
    """Return the sum of the first k elements in s.

    >>> a = Link(1, Link(6, Link(8)))
    >>> sum_iter(a, 2)
    7
    >>> sum_iter(a, 5)
    15
    >>> sum_iter(Link.empty, 1)
    0
    """
    # Don't call sum_rec or sum_iter
    """*** YOUR CODE HERE ***"""
```

Add `s.first` to the sum of the first `k-1` elements in `s.rest`. Your base case condition should include `s is Link.empty` so that you're checking whether `s` is empty before ever evaluating `s.first` or `s.rest`.

Introduce a new name, such as `total`, then repeatedly (in a `while` loop) add `s.first` to `total`, set `s = s.rest` to advance through the linked list, and reduce `k` by one.

Discussion time: When adding up numbers, the intermediate sums depend on the order. $(1 + 3) + 5$ and $1 + (3 + 5)$ both equal 9, but the first one makes 4 along the way while the second makes 8 along the way. For the same linked list `s` and length `k`, will `sum_rec` and `sum_iter` both make the same intermediate sums along the way?

Q2: Every Other

Implement `every_other`, which takes a linked list `s`. It mutates `s` such that all of the odd-indexed elements (using 0-based indexing) are removed from the list. For example:

```
>>> s = Link('a', Link('b', Link('c', Link('d'))))
>>> every_other(s)
>>> s.first
'a'
>>> s.rest.first
'c'
>>> s.rest.rest is Link.empty
True
```

If `s` contains fewer than two elements, `s` remains unchanged.

Do not return anything! `every_other` should mutate the original list.

```
def every_other(s):
    """Mutates a linked list so that all the odd-indexed elements are removed
    (using 0-based indexing).

    >>> s = Link(1, Link(2, Link(3, Link(4))))
    >>> every_other(s)
    >>> s
    Link(1, Link(3))
    >>> odd_length = Link(5, Link(3, Link(1)))
    >>> every_other(odd_length)
    >>> odd_length
    Link(5, Link(1))
    >>> singleton = Link(4)
    >>> every_other(singleton)
    >>> singleton
    Link(4)
    """
    """*** YOUR CODE HERE ***"""
```

Inheritance

Q3: Cat

Below is the implementation of a `Pet` class. Each pet has two instance attributes (`name` and `owner`), as well as one instance method (`talk`).

```
class Pet:

    def __init__(self, name, owner):
        self.name = name
        self.owner = owner

    def talk(self):
        print(self.name)
```

Implement the `Cat` class, which inherits from the `Pet` class seen above. To complete the implementation, override or implement the following methods:

`__init__`

Set the `Cat`'s `name` and `owner` attributes, and also add 2 new attributes:

1. `is_hungry` - should be set to `False`
2. `fullness` - should be set to whatever the `fullness` parameter is

Hint: You can call the `__init__` method of `Pet` (the superclass of `Cat`) to set a cat's `name` and `owner` using `super()`.

`talk`

Print out a cat's greeting, which is "<name of cat> says meow!".

`get_hungry`

Decrements a cat's `fullness` level by 1. When `fullness` reaches zero, `is_hungry` becomes `True`. If this is called after `fullness` has already reached zero, print the message "<name of cat> is hungry."

`eat`

This method is called when the cat eats some food.

If the cat is hungry, after calling this method both of the following should be true:

1. The cat's `fullness` value should be set to whatever `Cat.default_fullness` is.
2. The cat's `is_hungry` value should be `False`.

Also print out the food the cat ate. For example, if a cat named Thomas ate fish, print out 'Thomas ate a fish!'

Otherwise, if the cat wasn't hungry, print '<name of cat> is not hungry.'

```

class Cat(Pet):
    default_fullness = 5

    def __init__(self, name, owner, fullness=default_fullness):
        """
        >>> cat = Cat('Thomas', 'Tammy')
        >>> cat.name
        'Thomas'
        >>> cat.owner
        'Tammy'
        >>> cat.fullness # use default fullness value
        5
        >>> cat.is_hungry
        False
        >>> cat2 = Cat('Meow Meow', 'Yoobin', 3)
        >>> cat2.fullness # use fullness value that was passed in
        3
        """
        """ YOUR CODE HERE """

    def talk(self):
        """
        >>> Cat('Thomas', 'Tammy').talk()
        Thomas says meow!
        >>> Cat('Meow Meow', 'ThuyAnh').talk()
        Meow Meow says meow!
        """
        """ YOUR CODE HERE """

    def get_hungry(self):
        """
        >>> cat = Cat('Thomas', 'Tammy', 2)
        >>> cat.is_hungry
        False
        >>> cat.fullness
        2
        >>> cat.get_hungry()
        >>> cat.is_hungry
        False
        >>> cat.fullness
        1
        >>> cat.get_hungry()
        >>> cat.is_hungry
        True
        >>> cat.fullness
        2

```

Note: This worksheet is a problem bank - *not* a *note*. It will not cover all the problems in discussion section.
