CS 61A Summer 2018

Structure and Interpretation of Computer Programs

FINAL

INSTRUCTIONS

- You have 3 hours to complete the exam individually.
- The exam is closed book, closed notes, closed computer, and closed calculator, except for two hand-written $8.5" \times 11"$ crib sheets of your own creation.
- Mark your answers on the exam itself. We will not grade answers written on scratch paper.

POLICIES & CLARIFICATIONS

- You may use built-in Python functions that do not require import, such as min, max, pow, and abs.
- For fill-in-the blank coding problems, we will only grade work written in the provided blanks. You may only write one Python statement per blank line, and it must be indented to the level that the blank is indented.
- Unless otherwise specified, you are allowed to reference functions defined in previous parts of the same question.

1. (11 points) Jennifer and Chae's Cat Cafe

For each of the expressions in the table below, write the output displayed by the interactive Python interpreter when the expression is evaluated. The output may have multiple lines. Each expression has at least one line of output.

- If an error occurs, write **Error**, but include all output displayed before the error.
- To display a function value, write **FUNCTION**.
- If an expression would take forever to evaluate, write **FOREVER**.

Assume that you have started python3 (not ipython or other variants) and executed the code shown on the left first, then you evaluate each expression on the right in the order shown.

```
class Animal:
        def __init__(self, parent):
2
3
            self.parent = parent
            is_alive = False
4
5
        def __repr__(self):
            return 'cookie'
 6
        def __str__(self):
 7
            return 'I am an animal'
8
9
    class Cat(Animal):
10
        is_alive = True
11
12
13
        def meow(self):
            def meower(self):
14
                 if self.is_alive:
15
                     return 'meower'
16
                return 'I am a ghost!'
17
            print('meow')
18
19
            return meower
20
        def curiosity(self, cat):
21
            print('adventure')
22
            cat.is_alive = not self.is_alive
23
24
            return cat
25
    class CalicoCat(Cat):
26
        def __repr__(self):
27
28
            return 'brownie'
29
30
        def meow(self):
            print('purr')
31
32
            return Cat.meow(self)
33
   rachel = Cat(None)
34
   aaron = CalicoCat(rachel)
```

amy = Cat(None)

Expression	Interactive Output
print(4, 5) + 1	4 5 Error
print(aaron)	
CalicoCat.meow(rachel)

2. (8 points) Jemin Watches Some Soccer

Fill in the environment diagram that results from executing the code to the right until the entire program is finished, an error occurs, or all frames are filled. You may not need to use all of the spaces or frames. A complete answer will:

- Add all missing names and parent annotations to all local frames.
- Add all missing values created or referenced during execution.
- Show the return value for each local frame.

Return Value L

```
fa = 0
2
3
    def fi(fa):
        def world(cup):
            nonlocal fa
            fa = lambda fi: world or fa or fi
7
            world = 0
            if (not cup) or fa:
                fa(2022)
10
                fa, cup = world + 4, fa
                return cup(fa)
12
            return fa(cup)
13
        return world
14
15
   won = lambda opponent, x: opponent(x)
```

(b) (3 pt) Draw a box-and-pointer diagram for the state of the Scheme pairs after executing the block of code below. Please erase or cross out any boxes or pointers that are not part of a final diagram. This code does not error. We've provided the diagram for ex as an example. The built-in procedure length returns the length of a Scheme list.

```
(define ex '(1 2 3))
 2
3
    (define (f x)
4
      (if (= x 0)
5
          5
6
          (list x (f (- x 1))))
 7
8
    (define kate (f 3))
9
10
    (define (g x)
      (if (list? x) (length x) x))
11
12
    (define ajan (map g '(1 (2 (3)))))
13
```

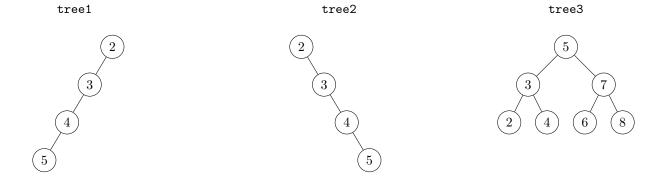

5

4. (3 points) BSTs

return False

The following questions reference the BST class and diagrams provided below.

```
class BST:
    # Other methods not shown
    def __contains__(self, e):
        if self.label == e:
            return True
        elif e > self.label and self.right is not BST.empty:
            return e in self.right
        elif self.left is not BST.empty:
            return e in self.left
```

- (a) (1 pt) Of tree1 and tree2, which are valid BSTs? O Both O tree1 only tree2 only O Neither
- (b) (1 pt) What is the runtime of the __contains__ method of the BST class with respect to n, the number of nodes in tree3? $\bigcirc \Theta(\log n)$ $\bigcirc \Theta(\sqrt{n})$ $\bigcirc \Theta(n)$ $\bigcirc \Theta(n^2)$ $\bigcirc \Theta(2^n)$
 - $\bigcirc \Theta(1)$

- (c) (1 pt) What is the runtime of the __contains__ method of the BST class with respect to h, the height of tree3? $\bigcirc \ \Theta(\log h) \qquad \qquad \bigcirc \ \Theta(\sqrt{h}) \qquad \qquad \bigcirc \ \Theta(h) \qquad \qquad \bigcirc \ \Theta(h^2) \qquad \qquad \bigcirc \ \Theta(2^h)$
 - $\bigcirc \Theta(1)$

Name:	

5. (9 points) Kevin and Griffin's Lunch Order

Kevin and Griffin are getting lunch before their sections. They each want to buy a main item, a snack, and a soft drink while staying within their budget.

(a) (2 pt) We represent the various lunch items with the Food class and its subclasses. There's a sale on snacks right now, so all snacks cost 40% less than their listed price. Berkeley charges a 5% tax on soft drinks, so those cost more than their base cost. Fill in the cost method for the Snack and SoftDrink classes.

For full credit, you must not hard-code the snack discount or the soda tax, in case they change in the future.

```
class Food:
   def __init__(self, name, base_cost):
       self.name = name
       self.base_cost = base_cost
   def cost(self):
       return self.base_cost
class Main(Food):
   type = "main"
class Snack(Food):
   type = "snack"
   discount = 0.4
   def cost(self):
       >>> chips = Snack("chips", 1)
       >>> chips.cost()
       0.6
class SoftDrink(Food):
   type = "softdrink"
   sugar_tax = 0.05
   def cost(self):
       >>> cola = SoftDrink("cola", 2)
       >>> cola.cost()
       2.1
       return _____
```

(b) (5 pt) Write three_sum_budget, which takes in three nonempty lists of positive numbers and a number n. This function should return the maximum sum less than or equal to n of one element from each of lst1, lst2, and lst3. If staying less than or equal to n is not possible, return 0.

```
def three_sum_budget(lst1, lst2, lst3, n):
  """Find the maximum sum <= n of one element from each of 1st1, 1st2, and 1st3.
  >>> three_sum_budget([1, 2, 3], [6, 8, 10], [4], 100)
  >>> three_sum_budget([1, 2, 4], [6, 8, 10], [2], 15)
  >>> three_sum_budget([1, 2, 3], [4, 5, 6], [1, 2, 4], 6)
  6
  .....
  def helper(lst1, lst2, lst3, total):
     if _____:
       return 0
     elif lst1 == "done":
       return _____
     options = []
     for item in 1st1:
       options.append(_____)
     return _____
  return helper(lst1, lst2, lst3, 0)
```

(c) (2 pt) Now let's put it all together. Implement lunch_cost, which takes in a list of foods (each one is either a Main, a Snack, or a SoftDrink) and a budget. Return the maximum you'll spend if you buy one of each item and your total cost does not exceed your budget. Use the functions and classes you wrote in parts (a) and (b).

```
def lunch_cost(foods, budget):
   11 11 11
   >>> lobster = Main('Lobster Tail', 25)
   >>> hotdog = Main('Hotdog', 5)
   >>> cider = SoftDrink('Sparkling Cider', 10)
   >>> cola = SoftDrink('Cola', 3)
   >>> fries = Snack('French Fries', 3)
   >>> lunch_cost([lobster, hotdog, cider, cola, fries], 100)
   37.3
   >>> lunch_cost([lobster, hotdog, cider, cola, fries], 25)
   17.3
   def costs_by_type(type):
      return _____
   mains = costs_by_type("main")
   snacks = costs_by_type("snack")
   drinks = costs_by_type("softdrink")
   return ______
```

Name:	
	0

6. (8 points) Christreena Finds Longer Paths

On HW 5, you wrote long_paths, which found all paths of a certain length that extend from the root to a leaf. Now, write longer_paths, which removes the restrictions that paths must begin at the root and end at a leaf.

The length of a path is the number of edges in the path (i.e. one less than the number of nodes in the path). A path may begin and end at any node. Paths must always go from one node to one of its branches; they may not go upwards. You do not need to worry about the order of the different paths.

The Tree class is provided below.

```
class Tree:
  def __init__(self, label, branches=[]):
                                  def is_leaf(self):
     self.label = label
                                      return not self.branches
     self.branches = list(branches)
def longer_paths(t, n):
  """Return a list of all paths in T with length at least N.
  >>> left = Tree(1, [Tree(2), Tree(3, [Tree(4)])])
                                              whole
  >>> longer_paths(left, 1)
  [[1, 2], [1, 3], [1, 3, 4], [3, 4]]
                                               0
  >>> right = Tree(5, [Tree(6, [Tree(7)])])

                                          left
                                                  right

     paths = []
     if _____:
       paths.append(______)
     for b in t.branches:
       for subpath in _____:
          paths.append(_____)
       if _____:
          paths.extend(_____)
     return _____
  return helper(t, n, True)
```

1. (1 polition burcaille alla scilliviato	7.	(7 points)	Streams	and J	Jennyrato	rs
---	----	------------	---------	-------	-----------	----

(a)	(1 pt) Write generate_constant, a generator function that repeatedly yields the same value forever.
def	<pre>generate_constant(x): """A generator function that repeats the same value X forever. >>> two = generate_constant(2) >>> next(two) 2 >>> next(two) 2 >>> sum([next(two) for _ in range(100)]) 200 """</pre>
(b)	(3 pt) Now implement black_hole, a generator that yields items in seq until one of them matches trap, in which case that value should be repeated yielded forever. You may assume that generate_constant works. You may not index into or slice seq.
def	<pre>black_hole(seq, trap): """A generator that yields items in SEQ until one of them matches TRAP, in which case that value should be repeatedly yielded forever. >>> trapped = black_hole([1, 2, 3], 2) >>> [next(trapped) for _ in range(6)] [1, 2, 2, 2, 2, 2] >>> list(black_hole(range(5), 7)) [0, 1, 2, 3, 4] """</pre>
	if:
	else:

(c) (3 pt) Now let's implement this in Scheme using streams. black-hole takes in an infinite stream of numbers and a value trap. It should return a stream that contains the items of stream until one of its elements matches trap, in which case the stream should repeat that value forever.
scm> (define (prefix s k) (if (= k 0) nil (cons (car s) (prefix (cdr-stream s) (- k 1)))))
<pre>prefix scm> (define (naturals start) (cons-stream start (naturals (+ start 1))))</pre>
naturals
scm> (prefix (black-hole (naturals 1) 3) 8) (1 2 3 3 3 3 3)
scm> (prefix (black-hole (naturals 5) 3) 5) (5 6 7 8 9)
(define (black-hole stream trap)
(cons-stream
(if
)))
///
8. (10 points) Nan-scheme Writes Cam-acros
In Python, we can do arithmetic using $infix$ notation, where the operator goes between two operands, e.g. 3 + 4. In Scheme, we have to use $prefix$ notation for all call expressions, e.g. (+ 3 4).
Let's add support for infix notation in Scheme!
(a) (2 pt) First, write the helper function skip, which skips the first n items in a list, returning the rest. For full credit, your solution must be tail recursive. You may assume that n is non-negative.
scm> (skip 2 '(1 2 3 4)) (3 4)
scm> (skip 10 '(1 2 3 4)) ()
(define (skip n lst)
(if

11

Name:

(b) (6 pt) Now let's write infix, which takes in a list containing some arithmetic in infix notation and evaluates it. You only need to support addition and multiplication, but you do need to take the order of operations and parentheses into account. You may use skip, as well as cadr and caddr.

```
1
2
3
4
5
 scm> (infix '(5))
                    scm > (infix '(2 + 3))
                                         scm > (infix '(2 * (3 + 6)))
 scm > (infix '(2 * 3))
                    scm > (infix '(2 * 3 + 6))
                                         scm > (infix '(2 + 3 * 6))
                    12
                                         20
 (define (infix expr)
   ((not (pair? expr)) expr); a single value
9
   ((or (equal? (car expr) '*) (equal? (car expr) '+)) (eval expr)); already in prefix form
10
   ((null? (cdr expr)) _____)
11
   (else
    (define left (infix ______))
12
    (define right (infix _____))
13
    (define operator _____)
    (cond
      ((equal? operator '+) (+ left _____))
      ((equal? operator '*) (infix (cons ______
                           _____)))))))
```

Name:	13
(c) (2 pt) infix is great, but it only works on number lie	terals. If we try to reference names, it errors.
<pre>scm> (define x 4) x scm> (infix '(x + 3)) Error: x is not a number</pre>	
We can fix this by making a macro instead. Let's say we o	define infix-macro as:
(define-macro (infix-macro . expr) (infix expr))	
Unfortunately, this doesn't quite work. What changes infix-macro works like the tests below?	would need to be made to the code in part (b) so that
<pre>scm> (infix-macro x + 3) 7</pre>	scm> (infix-macro 4 + (x + 3) * 5) 39
Please describe the specific changes you'd make and why	you'd make them, mentioning line numbers.

9. (6 points) Birthday Query Language

Tiffany's birthday is coming up and the CS 61A staff wants to throw her a party! She's put the times she's available in a SQL table called party_times. The party will last 2 hours. Unfortunately, all of the times Tiffany is available conflict with some staff member's section. Each staff member's section is listed in sections.

The time column of both tables refers to the number of hours after noon that a section or party starts at. The length column refers to the length of a section in hours. The tables below are not complete.

party_times
time
2
4
5.5
7
•••

sections			
staff_member	time	length	
"Daniel"	4.5	1	
"Jemmy"	3	1	
"Lauren"	2.5	1	
"Wenyuan"	1	2	

(a) (3 pt) First, let's make a table called available which has a row for every combination of a staff member and a time slot for which that staff member is available. Note that a staff member can be available for multiple times and there can be multiple staff members available for a given time.

A staff member is available for a timeslot if their section does not conflict with any part of it. If their section ends at the same time the party starts (or vice versa), the staff member can still attend the party. You may assume that each staff member only has 1 section on the day of the party.

For example, Lauren could attend a party at 4, since her section ends at 3.5, but could not attend a party at 2, since her section would overlap with it.

12. (0 points) Wan More Thing

Thank you all for a fantastic summer!

We've hidden the names of all the instructors, TAs, and tutors somewhere within the exam. Can you find them all? This isn't worth extra credit or anything. Obviously don't do this until you've finished the exam.

No more questions.
